EDUCATION

Marymount University

Bachelor of Science in Computer Science, Minor in Artificial Intelligence and Robotics

Arlington, VA

Aug. 2023 – May 2027

TECHNICAL SKILLS

Front-end: HTML, CSS, TypeScript, JavaScript, React, Vite

Back-end: C++, Java, Python, SQL, PostgreSQL, CMake, FastAPI

Data Science / Machine Learning: Pandas, Polars, NumPy, scikit-learn, Jupyter, PyTorch

AI / LLM Engineering: Claude API, AIP Logic, prompt engineering, structured output, evaluation design

Platforms: Palantir Foundry, Ontology SDK, Foundry Transforms, Workshop

Systems / Simulation: Unreal Engine, C++, Multi-threading, Graph Algorithms

Cloud / DevOps: AWS, Azure, Docker, Git/GitHub, OAuth2

Productivity & Collaboration: Microsoft Office, Google Workspace

EXPERIENCE

Federal Sales Intern

World Wide Technology

Washington D.C.

May 2026 – Aug. 2026

- Embedded with the Federal Systems Engineering team, supporting both pre-sale solution design and post-sale technical validation across WWT's OEM partner ecosystem for federal clients.
- Assisted in federal client engagements targeting agencies such as DISA, contributing to requirements discovery, technical scoping, and solution proposal development.
- Supported post-sale implementation workflows by contributing to technical documentation, configuration guidance, and cross-functional handoffs between engineering and delivery teams.

Information Technology Generalist Intern

Allan Myers

Fallston, MD

May 2025 – Aug. 2025

- Diagnosed and resolved 50+ weekly hardware and software tickets across 6 business units, reducing downtime by 30 percent.
- Led a company-wide device upgrade project, replacing 200+ end-user systems across field offices with minimal service disruption.
- Deployed AWS jumpboxes and Office 365 admin tools to improve remote access reliability, cutting login issues by 20 percent.

PROJECTS

Nightingale - Clinical Decision Support | *Palantir Foundry, AIP Logic, Python, TypeScript, React*

- Built an end-to-end ED triage decision support system on Palantir Foundry, spanning a Polars data pipeline, a typed ontology object, a Python rules engine implementing the ESI v4 algorithm with explicit guardrails, and a custom React frontend calling Foundry directly via the generated Ontology SDK.
- Engineered a hybrid rules-plus-LLM refinement layer in AIP Logic using Claude Opus, enforcing a hard safety ratchet that permits acuity escalation but never de-escalation, with every LLM contribution explicitly tagged for full audit traceability between deterministic and probabilistic reasoning.
- Evaluated the rules baseline against MIMIC-IV-ED ground truth achieving 99% within-one-level accuracy and zero dangerous Level 1 misses, and deployed per-user audit attribution via OAuth2 Authorization Code Flow without an intermediary backend service.

Synapse - Tactical Dashboard | *TypeScript, Python, React*

- Built a responsive Multi-Domain Operations dashboard using TypeScript and React, providing a unified tactical picture for visualizing synchronized assets across Air, Land, Sea, and Cyber domains.
- Engineered a Python backend using Asyncio to process real-time mission logic and telemetry, ensuring high-throughput state synchronization with the frontend visualization.
- Implemented type-safe data structures and communication protocols to bridge backend logic with web-based rendering, reducing integration latency and improving system reliability.
